

GlassBrowserAI Test Harness

Generated: 2026-01-09T18:00:05.292502Z

1. Agent Test Harness Overview

Agent test harness defines scenarios and expected outcomes for playbook runs. Results are evaluated against expected steps, events, and timing to detect regressions.

- AgentTestScenario: playbook + context + expected checks
- AgentTestRun: run metadata + status
- Evaluation metrics: duration, missing steps, forbidden events

2. Where It Integrates

- AgentTestHarnessPanel (UI)
- agentTestHarnessService.ts (normalize, evaluate, resolve playbook)
- Ledger storage via agent memories
